Downloading music with BitTorrent is an excellent way to get the most out of your Internet connection. It also lets you download large files much faster than other popular types of services such as HTTP and FTP. BitTorrent is made up of a client and a tracker that continually communicate with each other to download files. The client acts as a gateway into these files, while the tracker keeps track of all of the exchanges taking place between the client and the torrent downloader. While many trackers will allow you to upload music onto their sites, there are also many legitimate sites that will allow you to download music. All you have to do is search for "torrent" or something similar in your favorite search engine, look for one that hosts the type of music you want, select it from their list of content, and then forward it directly to your BitTorrent client. Your client will then use that torrent and find other users who want to download the same file in order to create a swarm. As the swarm downloads the file, it will upload pieces of that file onto your hard drive and to others in the swarm. If you're among the first in the swarm, you could end up with a very small piece of the original file, but if you wait until all of everyone else has finished downloading it, you may be given a much larger portion. Once your client has downloaded all of its pieces from other BitTorrent users, it will begin to reassemble them back into whole files so that your media player can use them. This process is extremely time consuming and, in most cases, simply downloading a single song from a swarm will take longer than any other method of obtaining the same file. The reason for this is that the tracker has to verify every piece downloaded from other users before it will upload it to you. If a piece has been tampered with in any way, your client will reject the whole file. If you're not sure whether a torrent is safe or not, look at the quality of the other pieces that have been uploaded to that torrent site. If all of them look very similar or are hosted by sites with no history or track record of hosting bad data, then all signs point toward a relatively safe torrent site experience.
